

Study number: 2015 1913

Programme: All intro students

Evaluation subject: Dynamic Models of Electrical and Control Systems

21 January at 9:30-13:30

Please write your study no. on all pages. Do not write your name as your evaluation is anonymous!

Total number of pages, including this page: 22

NB! Your paper must be easy to read. If this is not the case, your paper may be evaluated as "not passed".

All usual aids are allowed (notes, books, tables, calculator and PC). You are not allowed to communicate amongst each other or with the outside world which means that the use of mobile phone, Wi-Fi, internet, email is not is not allowed.

You are allowed to take the examination questions with you. But you are NOT allowed to take them with you if you leave the room before the examination has ended.

Puoblem 1

1) $f_{I}^{2} = 10 e^{j45}$ [given]

where f_{I} is defined as auruent rector.

Let phase auruents in phases a,blo

be defined as f_{Ia} , f_{Ib} . If f_{Ic} Mespechively.

$$f_{Ia} = Re(f_{I}) = Re[10e^{i45}]$$

= 10 cos 45°

= 7.071 A

$$\Rightarrow f_{Ib} = \frac{\text{Re}(\bar{f})}{e^{j2\pi/3}} = \frac{\text{Re}(10e^{j45})}{e^{j2\pi/3}}$$

$$= \int_{-j2\pi/3}^{2\pi/3} = \frac{\text{Re}(10e^{j45})}{-j2\pi/3}$$

$$= -9.66 A$$

Problem 1.

(2) Let the dq component of the current vector be defined as

fil & fig suspectively.

As given in quistion; d-anis leads a-anis by 90° & we know 9 anis leads d'anis by

 $\Rightarrow f_{Id} = 10 \cos(-45^\circ)$ = 7.071 A

Now for the quaponent.

$$f Tq = \frac{Re(10e^{i45})}{e^{i180°}} = \frac{Re(10e^{i(45-180°)})}{e^{i180°}}$$

$$\Rightarrow f_{1q} = 10 \cos(-135^{\circ})$$

$$= -7.071 A$$

Problem 1.

(3) Let the subtating speed of de sufference frame be wor rads

As given in question,

angular velocity of current vector $w_c = 2\pi.50 = 314.16$ rad

Now, the sulative speed difference between the day sufference frame & the space current vector will cause the difference in angle.

Problem 1

(3)

Q:-3 contd.

So, Aspen question the dans leads the space current vector by 90° which means the change in angle de. $90^{\circ}-45^{\circ}=45^{\circ}=40$, occurred during the time interval of t=0.05 seconds due to the sulative speed.

so, we can say that.

(Wr - We) time = DQ

 \Rightarrow ($W_{r} - 314.16$)(0.05) = $45^{\circ} = \frac{\pi}{4}$

J 0.05 Wy - 15.71 = 1

=) 0.05 Wr = 15.71 + 0.785 = 16.5

$$60 \quad W_{r} = 16.5 \quad 0.05$$

= 329.91 rad 5'

o'. The swotching speed of de suferience frame is 329.91 rad s'

Problem 1

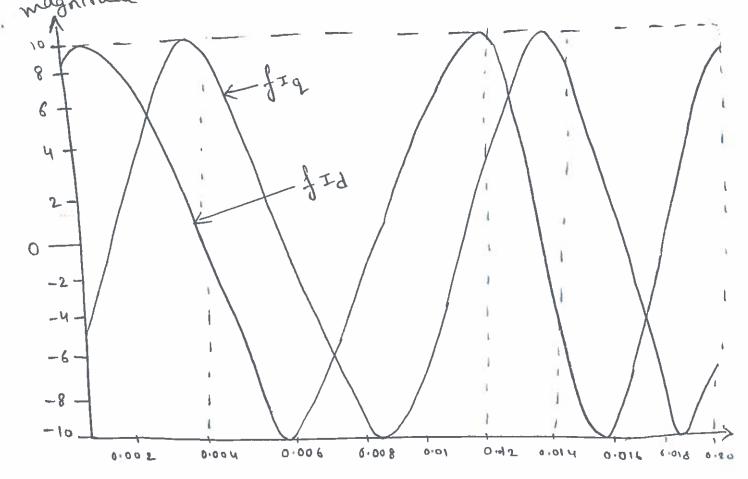

4) As given in the question:

Let the courseponding d 2 g component be fid & fig.

Problem 1.

Substituting we = 314.16 rad s'

The sketch of the d., q-wavefourns
has four the time period [0,0.002] second
have been obtained using "Matlab"
magnitude.

(5)

Question 4 conta

As pen the sketch in the pourrous page, it must be noted that the "blue" waveform suferies depresents the q aris current component I the "guy" waveform superesents the danis current component.

Problem 1.

Question 5

In about sufference frame we have phase at that always aligns witiely with the real axis.

We also know that the space vector used to suppresent in α , β system is given as. where $\lambda = alpha$ $\lambda = \beta = \beta = 1$

The above equation clearly states that the 'd' component is aligned along the Real anis of the Co-oudinate system. Therefore, we can say that the alfa 'd' component in d, R system is same as the phase 'a' component in a, b, c superence frame.

To component is is used.

Pewblem 1.

(5) continued.

a, B to a, b, c tuansfoundion:

$$\begin{cases}
fa \\
fb
\end{cases} = \begin{bmatrix}
1 & 0 \\
-\frac{1}{2} & \frac{\sqrt{3}}{2} \\
-\frac{1}{2} & \frac{\sqrt{3}}{2} & \frac{1}{2}
\end{cases}$$

$$\begin{cases}
f^{\alpha} \\
f^{$$

o. We see that

Puoved.

Problem 2

(1) Let the mutual inductance between stator phase - a & & stator phase - a be

Mases

) Mases = Laaq Re
$$\left(\frac{e^{j\Theta}}{e^{jO^{*}}}\right)$$
. Re $\left(\frac{e^{j\Theta}}{e^{j2\pi/2}}\right)$ + Laad Re $\left(\frac{e^{j(\Theta-\pi/2)}}{e^{j\Theta}}\right)$. Re $\left(\frac{e^{j(\Theta-\pi/2)}}{e^{j\Theta}}\right)$. Re $\left(\frac{e^{j(\Theta-\pi/2)}}{e^{j2\pi/3}}\right)$

(We know that. (Os (A+B) + Cos (A-B) = 2 cos A. cos B (Os (A-B) - Cos (A+B) = 2 sin A. sin B

1) contd.

$$\frac{\text{Laad}}{2} \left[\cos \left(9 - 8 - 2 \sqrt{3} \right) - \cos \left(9 + 9 + 2 \sqrt{3} \right) \right]$$

$$=) Lm_{s} \left[\cos \left(20 + 2 \sqrt{3} \right) + \cos \left(-2 \sqrt{3} \right) + \right] \\ \left[\cos \left(-2 \sqrt{3} \right) - \cos \left(20 + 2 \sqrt{3} \right) \right]$$

Problem 2.

(2) Let the mutual unductionice between wotor phase-b & stator phase a be Masbr.

Masbr = Laaq Re
$$\left(\frac{e^{jQ}}{e^{jQ}}\right)$$
. Re $\left(\frac{e^{-iQ}}{e^{j(Q+2iQ)}}\right)$.
Laad Re $\left(\frac{e^{j(Q-iQ/2)}}{e^{jQ}}\right)$. Re $\left(\frac{e^{-i(Q-iQ/2)}}{e^{j(Q+2iQ/3)}}\right)$

 \Rightarrow Laaq Cos(Q). Cos(Q-Qr-2 $\pi/3$) + Laad Sin(Q). Sin(Q-Qr-2 $\pi/3$)

[we know that Cos(A+B) + Cos(A-B) = 2 cos A. cos B Cos(A-B) - cos(A+B) = 2 sin A. sin B

Problem 2

20151913

8

(2) continued.

=) Masbr =
$$\frac{1}{2} \left[\cos \left(Q + Q - Q_{8} - 2 \overline{\gamma}_{3} \right) + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right] + \frac{1}{2} \left[\cos \left(8 - 8 + Q_{7} + 2 \overline{\gamma}_{3} \right) \right$$

Laad
$$\left[\cos \left(\frac{8-8+0_{1}+2\pi \sqrt{3}}{2} \right) - \right]$$

 $\left[\cos \left(\frac{9+0_{1}-2\pi \sqrt{3}}{2} \right) \right]$

Congidening Laad = Laag = Long

$$=) Lms \left(\cos \left(\frac{20-0}{7} - \frac{2\pi}{3} \right) + \cos \left(\frac{0}{7} + \frac{2\pi}{3} \right) + \frac{1}{2} \left(\cos \left(\frac{0}{7} + \frac{2\pi}{3} \right) - \cos \left(\frac{20-0}{7} - \frac{2\pi}{3} \right) \right) \right)$$

$$=) Masbr = \frac{Lms}{2} \left[2 \cos \left(Q_r + 2 \pi /_3 \right) \right]$$

Problem 2

3) Goven:

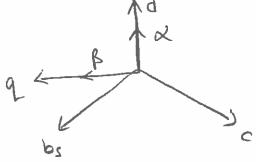

rotor speed on shaft = 240 rpm
no. af pole pains (Pp) = 4
Let rotor angular relocity be wr

Wr = 2M xPp x [rotor speed in spm]

=> Wr = 211 x 4 x 240

= 100.531 rad s-1

(4) As given in question,

(9)

(4) contd.

Problem,

Now in this I the space vector

suppresention the vector in 9d sufference

Re is f = fd + ifq - 0

the space vector supresenting in α , β sufference is $f = f \times + 9 f \beta$. $- \infty$

Co sidelating () l (1) we have $fd = f \times l + g = f \cdot l + g \cdot$

Uqs = Rs.iqs + PAqs + wo Ads + wo Ads

Uds = Rs.ids + PAds - wo Aqs - (10)

In equation (11) perplating all qld components with Bld components despecherely we get. [Wo=0 radis'] UBS = RSIBS + PABS + WO 7 25 Uxs = Rsias + pars - Wa ars © Urs = Rsias + pars Duxs = Rsias + pars Now, whiting for rotor side voltage equation. Vgrzk's.igr + pågr + (wo-wr)2/dr U'dr = R'r. i'dr + p \(\frac{1}{dr} \) \(\frac{1}{qr} \) Replacing & Rooq, d components in eq = (1) & (1) with B, X components

eq = () L () with B, & components

respectively we get (wo = 0 radio)

UBY = R'r. iB' + P N'Br + (wo-w.) N'dr

U'xr = R'r. ixr + P N'xr - (wo-w.) N'Br

Problem 2

2015 1913

(10)

(4) contd.

 $V'_{Rr} = R'_{r} \cdot i'_{Rr} + P \lambda'_{Rr} - w_{r} \lambda'_{Xr}$ $V'_{Xr} = R'_{r} \cdot i'_{Xr} + P \lambda'_{Xr} + w_{r} \lambda'_{Rr}$

Problem 3

(1) giren:

Rated shaft power = 0.6kw

Rated stator voltage (VL) = Woov

Rated stator Current (I) = 2.1A

COS () = 0.6

motor's efficiency = Output Power

(2) The equivalent circuit of an induction motor is given below to stator side only.

Stator side only.

Us 1

Us 2

Jus 31 m

(2) Since nothing in quision is mentioned about stator susistance vottage compensation, so we have to find the voltage after the Stator susistance, i.e. object in the diagram as Usq.

From the diagram from the previous page, we can clearly state that

Venpre = Vpnpk Ipnpk to stater sies stance

- VSAPK - 400 N2 - 2-1 × √2 × 12

=326.59935.64

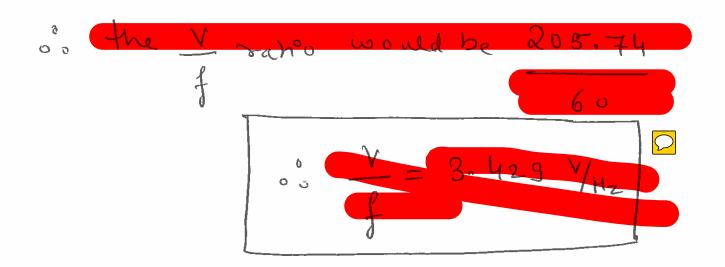

2290.961 Vpk.

Usa = Us - IsRs

= 230.94 - 25.2

As givenin question for 60Hz.

3) As the subsistance is neglected. So, Us = USA

(12)

(3) Contd.

$$W_{S} = 2\pi f_{S} = 2\pi \times 60$$

$$= 376.99 \text{ rad s}^{1}$$

$$= 3777 \times 100$$

Let the stator flux Linkage be 'As'

$$\lambda_{s} = \frac{U_{sph peak}}{W_{s}} = \frac{326.6}{377} = \frac{0.866 \text{ V/radis}}{377}$$

(4) The motor is suguined to run as 0.25 Hz.

So, now we have to find fs.

'. Stated = fs rated - frotor speed rated

fs rated.

W; rated

ודשטטוצווו א

14) Since the slip does not change, (13)
Thus.

Srated = fsnew-frnew
fsnew

$$= \int 0.056 = \int snew - 0.25$$

$$= \int frew = 0.25H_2$$

$$= \int grean in$$

$$= grestion.$$

=) fs(new)

 $6.0 \text{ fsnew} = \frac{0.25}{0.944} = 0.265 \text{ Hz}$

As pen question, the stator flux linkage (Is) should memain the same is $\Lambda_s = 0.866 \text{ V/rads}$.

Whenew = 2π finew = 2π of 0.265 Hz = 1.664 radsi

We know that

(14)

Les Magnitude of phase voltage after phase sussistère polsup compensation às

(5) We know, Srated= 0.056

We know that,

$$=) \int 8e = \frac{1}{4} \times 0.056 \times 60$$

we know that the shaft spoed frequency

now (frnow) = 15Hz

So, the stator frequency (frnow) has to be

found.

0.84 = frnow 15

0.84 = frnow 15

New step (3new) = frnow

2015/313 2015/313 15.84 15/84 = 0.053

Problem 3

5) conta.

So, now we know is rated = 60Hz

I fre = 0.84 Hz

becomes , for new = forward + fre

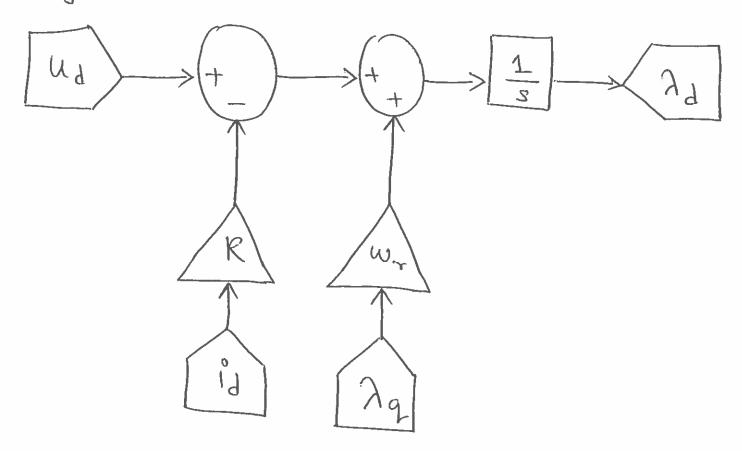

= 60 + 0.84

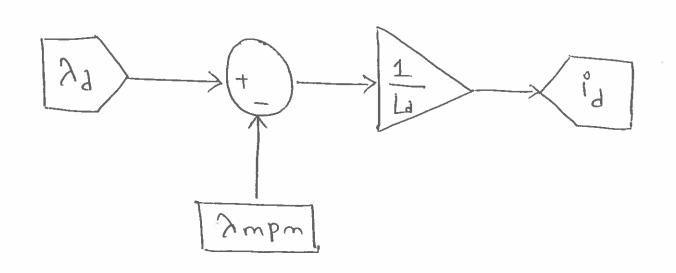

= 60.84Hz

of se = 0.84 Hz is the slip fuguery that needs padded to the fuguery command.

Problem 4.

(1) Block diagnam in Simulink, to get d-anis Jaurent.

Thus at t=0, we will have y9 = Jubu

Problem 4

(3) In I/F continol of the PM machine, the current rector should be lagging the q-anis.

S J W C W C

Let 8 be the angle defined between current vector I & q ani.

The electus mechanical touque Equation:

Te-Thad = Jdwr dt

We assume that the Convert vector

I stotates with an angular relocally of 'We' stad s' & the qd and subtates with an angular red velocity of 'Wr' rad s'

3) emplaination,

20151913

17

Case I : Required for stable operation.

I (consent vector) lags the q-anis.

In this case, considering Troad increases then the speed of subtation of the coverent vector (I) increases with suspect to the angular velocity of motation of qd sufference frame. As a subsult of which is decreases, which believes the coverent vectors closer to the qanis.

Thereby increasing the qanis current(ig). We know that Tex Te x ig " So

when ig incurases, electromechanical torque Te'also incurases. Thus the difference in touque between Te & Troad [Te-Twad] is maintained and thus the angular ved velocity of the gd a suference increase and frame I is maintained and stability of the system is observed.

Case: 2 [Unstable operation] How Not new monded.]

However, if the Current vector I's leads the quarts. Then, when the load toughe Thood snoweases, the qd reference frame angular relocity decreases. This leads to snowease in S', i. e the phase difference between I & quaris.

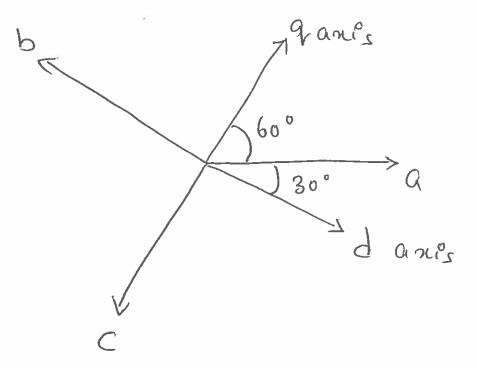

3) g conts.

Thus in this condition, we see that as the '8' increases the current rector I moves away from the q-amis thus further reducing the quaris current. I we know that "Te & i'q". So with decuease in iq, Te also Continuously keeps decuesing. Then the Bys difference Te-Troad keeps increasing with time & System becomes unstable.

Thus for stable operation the Current vector I's should lay the q-anis.

y) As given in question, the system is a dq sufference feame.

The rotor position (i.e. danis)
is -30 electrical degrees, when phase 'a' rollage chosses 'sero' from negative to positive.

to Phase a' voltage will be zero, when the voltage space vector will be at ± 90° to phase a' voltage. Va

4) Contd.

Va = Re (
$$\frac{\overline{V}_f e^{i90^\circ}}{e^{i0^\circ}}$$
)

Let vij be the voltage space vector L va is the phase a voltage.

So to Van

So, for Va to be 'O' volts. Vy should

either be at +90° Ox at -90° keythe

with surpertional

Cozordi [i.e. 90° leading or 90° legging]

at the instant when Va=0.

But from the graspon we see that,

at 3000 the the voltage vector of

has to be represented when phase a

voltage crosses the 3000, from

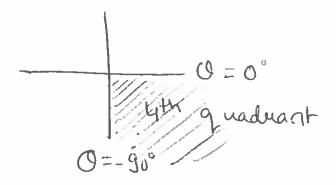

negative to positive, who

So, if we consider the voltage space Vector \overline{V}_{j} to be leading 'a' and by 90°, then after the zero crossing, the phase 'a' voltage should be to become more hegative. So, \overline{V}_{j} cannot lead a - and by 90° at the instant when \overline{V}_{a} crosses the zero voltage from negative to positive.

4) conta.

However, if we consider voltage space vector (V_f) to be lagging

a - phase voltage by 90° at the instant when va is 3000. Then we observe that with time, Vy more towards positive value of vaphase as now, Vy will enter the 4th quadrant, defined between 0=-90° to 0-500=0°.

In 4th quadrant @ cos 0 = positive value.

o's Va = Vf (Reej(0)) for Objeque Loco

Va will have positive value.

Thus Vy should be lagging a - anis
by 90° at the instant when the
a anis phase voltage cuosses zero, from
negative to positive.
phase banis

phase canis

where Vg = Voltage space rector.

From the graph we can see that,

360 degrees = 0.02 x degrees

dévision

Problem 4.

20151913

So for 0.00167 × 18000 = 30 degrees.

peu graph a anis phase current lags

a anis phase voltage by 30°.

So, the pha voltage space vector (Îj) lags the voltage space vector by 30° as well.
